Release announcement: ESET Endpoint Antivirus/Security 10.1.2058.0 (incl. global Auto-updates channel)

2023-10-30 - Steef | ESET Nederland - Comments (0) - Releases

For the time being all ESET Endpoints with regular online connectivity will start to upgrade to a newer version only after manual activation of the "Check for updates"-button in endpoint's main user interface, or remotely using the "Check for product update"-task in ESET PROTECT console (version 10.1 and later). This holds good until November 9th, 2023, when the release window will continue with controlled update progress (50% serving ratio) to make the rollout curve smooth on the update servers, as well as on our customers' side, until finally serving all requests from November 23rd, 2023.

The installation binaries are now available for manual deployment and published in the software repository of ESET PROTECT and in the download section of ESET global website.

Changelog:

- Fixed: Specific VB macro based malware not detected in docx documents
- Fixed: GUI crash when navigating to Network connections list
- Fixed: Operating system freezes caused by Endpoint Security product having unavailable network path excluded
- Fixed: Vulnerability & Patch Management feature not available after Auto-update
- Fixed: Check for Azure code signing compatibility of Operating system during installation
- Improved: Extended possible columns in Firewall rule list
