Create databases and database user accounts for ESET Remote Administrator (6.x)

Ondersteuning | ESET Nederland - 2025-03-07 - Comments (0) - 6.x

<https://support.eset.com/kb6212>

Issue

You do not have an appropriate database for your ERA Server or ERA Proxy installation

You want to set up a dedicated database user for MS SQL or MySQL

Details

Solution

How to create a database and user for ESET Remote Administrator in MS SQL

A dedicated database must have at least one dedicated user

Do not use the same database user for more components or purposes. Each component (ERA Server, ERA Proxy) needs its **own database** and database user.

Prerequisites:

You must have administrative access to the OS.

[Microsoft SQL Server Management Studio](#) must be installed (in this example SQL Server 2016 is used).

You must have an administrative account in Microsoft SQL Server Management Studio.

Create database:

1. Open the MS SQL Server Management Studio and login with your Administrator account.
2. In the **Object Explorer** right-click **Databases** and select **New Database...** from the context menu.
3. Enter a name for your database. We recommend that you use a name that suits the database's purpose, like era_db or era_proxy.

Type the database name in the **Database name** text box. You will need this name during the installation of ESET Remote Administrator.

4. Click **OK** and continue to the next section to assign a new user to your database.

Create and assign new user:

1. Open MS SQL Server Management Studio and log in with your Administrator account.
2. In **Object Explorer**, right-click **Security** → **New** → **Login...**
3. Type the user name of your new user in the **Login name** field.
4. Select the **SQL Server authentication** option.
5. Set your new password and type it in the **Password** and **Confirm password** fields. You can also set other properties here, but it is not required.
6. Select **User Mapping** and then click **Map** next to the database you created. Your user name should appear in the

column **User** next to the database you selected.

7. Select the field **db_owner** in the **Database role membership** window. Click **OK** to save your changes.

Keep your credentials safe!

You will need your database name and credentials (username and password) during ESET Remote Administrator installation.

How to create a database and user for ESET Remote Administrator in MySQL

Prerequisites:

You must have administrative access to the OS.

MySQL must be installed.

You must have an administrator account in MySQL.

In this article, we will use [HeidiSQL](#) as our administration tool. You can use a different tool or the command line to achieve the same results, however some steps may differ according to the tool you use.

Create database:

1. Open your MySQL administration tool and log in to the local database using the root account and password. Set the **Hostname** as 127.0.0.1 .
2. Click **Open** to open your session. Right-click **root** and

select **Create new** → **Database** from the context menu.

3. Enter a name for your database. We recommend that you use a name that suits the database's purpose, like `era_db` or `era_proxy`.

Create and assign new user:

1. Open your MySQL administration tool and log in to the local database using a root account.
2. Set the **Hostname** to `127.0.0.1`.
3. Click **Tools** → **User management** and then click **Add**.
4. Type name of new user in to the **Username** field.
We recommend that you use a self-explanatory username like `era_db_user`. Set a secure password in the **Password** and **Repeat password** text boxes.
5. Set the **From host** value to **Access form everywhere**.
6. Click **Add object**, add the database you created earlier and then click **OK**.
7. Under **Allow access to**, select the new database and mark the following properties:
 - ALTER
 - ALTER ROUTINE
 - CREATE, CREATE ROUTINE
 - CREATE TEMPORARY TABLES
 - CREATE VIEW
 - DELETE, DROP
 - EXECUTE
 - INDEX
 - INSERT
 - LOCK TABLES
 - SELECT
 - UPDATE
 - TRIGGER.

8. Click **Save** to confirm the user settings and then click **Clone**. You will now have two users with same name. For the newly copied user, change the value of **From host** to **Access from server location only** and then click **Save**.
