Details

Solution

Getting Started with ESMC: Step 4 of 6

← **Add Client Computers** | **Deploy ESET endpoint solutions** →

The ESET Management Agent can be installed using Local Deployment or Remote Deployment. Read the descriptions below and then click the appropriate link to view step-by-step instructions:

Local Deployment

- All-in-one installer (Windows only): Download the ESET Management Agent and your ESET security product in the same package.
- Agent Live Installer: Client computers receive a pre-configured Live Installer package from the ESMC Server in the form of a batch (.bat) file. The admin or user runs the batch file to download and install ESET Management Agent. This is the suggested method for small to medium-sized networks.
- Download Agent from ESET website: Manually download the ESET Management Agent on your client computer and choose from a Server-assisted or Offline installation.

Remote Deployment

- Use GPO or SCCM for deployment: Distribute the ESET Management Agent for enterprise environments or environments with a high number of client computers.
- Server Task Agent installation: Use the ESMC Web Console to locate unmanaged computers, execute a server task, and silently install the ESET Management Agent on clients. This is the suggested method for enterprise applications.
- Deployment tool: It is a convenient way to distribute the ESET Management Agent together with an ESET product on client computers. It enables you to use custom created installers. ESET Remote Deployment Tool is dedicated to deploy ESET Management Agent to client computers with Microsoft Windows operating systems.

If you are performing a new installation of ESMC, proceed to Step 5, deploy ESET endpoint products to your client computers.
