Discovering the installed DESlock+ Client version from the Enterprise Server.

Anish | ESET Nederland - 2018-01-24 - Comments (0) - ESET Endpoint Encryption

If you would like to discover which client machines have DESlock+ installed within your organisation and which version is installed, this can be achieved simply by clicking on 'Organisation Management' within the Enterprise Server and then selecting the 'Reporting' tab.

Under the 'Workstation' section, click 'DESlock+ Client Version' to highlight it and then click 'Run'. This will generate the report within the right hand side pane. The report can also be generated as either a CSV (Comma Separated Value) or PDF document.

If the DESlock+ Version is displaying as 'not available', it is because a user has been issued a licence however they have yet to activate their version of DESlock+.
