Does a Full Disk Encrypted computer need to be decrypted to upgrade DESlock+?

Anish | ESET Nederland - 2018-03-07 - Comments (0) - ESET Endpoint Encryption

In normal circumstances DESlock+ can seamlessly upgrade a Full Disk Encrypted (FDE) workstation.

In some rare cases, disks encrypted with older versions of DESlock+ will need to be decrypted before upgrading. The installation will detect and prompt when necessary.

Decryption will be required in either of the following two cases:

- The installed version of DESlock+ is older than 4.1, which was superseded in August 2011.

- The pre-boot authentication screen shows a version of 0.78 or older. This can only happen if the installation used to Full Disk Encrypt the system was older than v4.1.13.232 (released in February 2011).
