Error after resetting User password in Windows Computer Management

Anish | ESET Nederland - 2018-01-23 - [Comments (0)](#) - [ESET Endpoint Encryption](#)

Problem

After resetting a Windows User password in Computer Management from an Administrator account, you receive the following error dialog when trying to access the key-file from the User's profile:

Key not valid for use in specified state.

(Error 0x8009000B reported by "Windows System Error")

Cause

When forcing the Windows User's password to reset in Computer Management you will see this warning dialog:

A password reset is more complex than a password change because Windows stores certain User data inside a 'Master Key'. Because the Administrator is not logged on as the User in question, they do not have access to the User's old password. This means that the old password cannot be used to decrypt the old Master Key and re-encrypt it with the new password. As DESlock+ uses the Windows Cryptography API, resetting the password causes DESlock+ to lose access to the Master Key.

Solution

There are two ways to resolve this issue:

1. Revert the Windows password change back to the previous password

or

2. First reset the activation state of the Workstation and then activate the User again. This will set the key-file to the new Windows password. See these articles for more information:
