Solution

After you have [created your Mirror server](#), you must configure client workstations to access it for updates.

For networks with 400 or more clients

On large networks with more than 400 client workstations, we recommend [balancing mirror updates among additional mirror servers](#). If the mirror needs to be centralized on a single server, we recommend using another type of HTTP server, such as Apache or IIS.

Configuring clients to access the Mirror server

1. Open the main program window by double-clicking the ESET icon  in your Windows notification area or by clicking **Start → All Programs → ESET → ESET Endpoint Security** or **ESET Endpoint Antivirus**.
2. Press the **F5** key to display the Advanced Setup window. From the tree structure on the left, expand **Update → General** and then click **Edit...**

3. To add your Mirror server as an update server, enter the server name or IP address in the following format:
http://*your_server_name*:2221 or http://xxx.xxx.xxx.xxx:2221.
4. Click **Add**, and then click **OK** to return to the Advanced Setup window.

5. Make sure the **Username** and **Password** fields are blank and that the Mirror server name or address is visible. Click **OK** once more to save your settings and close the Advanced Setup window. The ESET client(s) you have just configured should now update successfully from the Mirror server.
