How do I remove Single Sign-On? (SSO)

Anish | ESET Nederland - 2018-01-24 - Comments (0) - ESET Endpoint Encryption

If you would like remove the Single Sign-On (SSO) feature for a managed User's Full Disk Encryption (FDE) login, then please follow these steps.

Login to your Enterprise Server console

View the **Workstation Details** of the machine you wish to update
(see: [KB332 - How do I view Workstation Details?](#))

Click the **FDE Logins** tab at the top

Select the FDE user and click **Change**

Click the FDE Login Type to **Normal login**

Optional: Choose a new password for the User by checking the **Set Password** box and completing the fields

When you are finished click **Post Change**

Either wait for the client to synchronize with the Enterprise Server or manually synchronize (see: [KB195 - How do I manually synchronise the Enterprise Server and DESlock+ client?](#))

The User will either have to set their own FDE login password or use the password you have specified

Keywords: SSO, change, how do I, login, FDE
