How to use the Bootloader Keyboard Manager

Anish | ESET Nederland - 2018-02-20 - Comments (0) - ESET Endpoint Encryption

If you currently don't have the keyboard language you desire at the Full Disk Encryption Pre-Boot screen, you can use our 'BootloaderKeyboardManager' to add it.

To find what keyboard map you're currently using, check the bottom left corner of the Pre-Boot screen. In our example, the keyboard map is currently set to US.

Please see our article below for a full list of supported keyboard maps and languages:

How to use the Bootloader Keyboard Manager

Double click the '**BootloaderKeyboardManager**' in the **DESlock+** folder, which is usually found in C:\Program Files\

Alternatively, in DESlock+ version 4.8.15 or greater you can Right-click on the **DESlock+ icon** in the system tray and select **Settings**, select the **Full Disk Encryption** tab, then click **Manage** located in the 'Bootloader Keyboard Manager' section.

The Keyboard Manager will open and display the default keyboard map you currently have.

To add a keyboard, click **Add**, this will open and display the list of supported keyboard maps.

Select the keyboard map you wish to use at the Pre-Boot screen and click **Add**, then click **OK**.

When you reboot, the key map you have selected should be available for use.
