Windows 8 compatibility

Anish | ESET Nederland - 2018-02-07 - Comments (0) - ESET Endpoint Encryption

In order to use Full Disk Encryption on Windows 8 you must use client v4.7.4 or later. This client includes support for GPT, UEFI and Secure Boot technologies. These technologies are a requirement of machines supplied by manufacturers that display the Windows 8 certified logo.

Client versions previous to v4.7.4 will function with Windows 8 allowing all features of the product with the exception of Full Disk Encryption which is unable to be performed if the system is using UEFI or GPT.

The DESlock+ client does not support the RT editions of Windows 8.

Full Disk Encryption can be used on tablets running Windows 8 but you will need to connect a USB keyboard in order to enter your FDE user credentials when starting the system.
