ESET Security for Linux is not compatible with SELinux and grsecurity.

If you have problems with **SELinux** and you do not need it, you can switch the system into permissive mode with the following commands:

```
echo 0 > /selinux/enforce
vi /etc/selinux/config
```

Set SELinux to "disabled" in configuration file.

```
SELINUX=disabled
```

For **grsecurity**, add a trusted group and add the user *esets* to the group.

```
# groupadd -g <GID> grsecgroup
# vi /etc/group
grsecgroup:x:123:esets #Example
```

Enable 'Trusted Path Execution (TPE)' and 'Invert GID option' within grsecurity.

> You can also do this the same way via sysctl command:

To enable grsecurity permanently, edit the /etc/sysctl.conf and add the following lines:
