ESET Tech Center

FDE Username Caching

To allow the FDE login screen to remember the last logged in username, you will have to configure the **Full Disk Encryption** Workstation policy:

Note: Username caching is only available for UEFI workstations.

Configure the **Allow FDE Username Caching** policy to **Yes** by following the article below:

[KB229 - How do I modify workstation policy?](#)

Once the setting has been configured, after the first user has logged in, the username will be cached and displayed at the next reboot as shown below:

If you want to check that the policy has been applied, open the Windows Registry and check that the '**FDEStickyUsername**' policy value is set to (1) in the pathway as shown below.

[HKEY_LOCAL_MACHINE\SOFTWARE\DESlock\Client\Policy]

FDEStickyUsername = 1

Keywords: cached credentials remember fde login
