#### lssue

• Upgrade an MS SQL Server Express instance installed with ESET PROTECT

## Details

SQL Express is a free version of SQL from Microsoft that comes with some limitations. It can utilize a maximum **1 GB** of RAM per instance, the maximum database size is 10 GB, and there can be a maximum of 50 instances per server. SQL Express is limited to either 1 socket or 4 cores, so if you need a more powerful environment, you may consider upgrading to a higher SQL Server edition.

The following upgrade process is very similar for the SQL Server Express 2008 R2 and later versions. In order to upgrade, you must temporarily stop the ESET PROTECT Server service and create a full database backup in case the upgrade process does not finish properly. To check the supported version and edition upgrade options, see the SQL Express vendor <u>documentation</u>.

## Solution

 The ESET PROTECT Server version 8.x All-in-one installer uses SQL Express 2019 by default. To check which version of SQL Server you are using, check the error log located by default at C:\Program Files\Microsoft SQL Server\MSSQL.n\MSSQL\Log\ERRORLOG and ERRORLOG.n The version of MS SQL Server is specified in the first rows of the log.

- 2. <u>Stop</u> the ESET PROTECT Server Service.
- 3. Create a <u>full database backup</u>. We recommend that you specify a new backup set name. If you do not specify a new backup set name and the existing name has already been used, the new backup will be appended to the existing file and create an unnecessarily large backup file.
- 4. Depending on the type of media you will use for the upgrade, mount the SQL Server installation ISO or execute the installation package to launch the installation process.
- 5. In the SQL Server Installation Center window, click Maintenance → Edition

#### **Upgrade** to launch a wizard to change your edition of SQL Server.
