What are Workstation and Group Policy?

Anish | ESET Nederland - 2018-01-30 - Reacties (0) - ESET Endpoint Encryption

When a workstation is being managed by an Enterprise Server policies are available which allow the administrator to control how DESlock+ functions for their users.

There are two separate collections of policies:

Workstation Policy

Workstation Policy takes effect when the current Windows user is not activated against the Enterprise Server or they are not currently logged in to the DESlock+ software.

Installing a client install package obtained from the Enterprise Server will enforce the Workstation Policy from the Enterprise Server chosen at the time it was downloaded.

Workstation Policy is the baseline of rights and includes settings for how the software will appear and behave.

Group Policy

Group Policy takes effect when an activated user logs in to their Key-file. Generally these settings are used to grant extra rights or features to the users overriding any restrictions set by the Workstation Policy.

By arranging users within teams in the Enterprise Server interface it is possible to apply different Group Policy settings to different teams of users. This allows you to give extra capabilities to specific teams of users.
